CHAPTER 1

PyHamcrest Tutorial

1.1 Introduction

PyHamcrest is a framework for writing matcher objects, allowing you to declaratively define "match" rules. There are a number of situations where matchers are invaluable, such as UI validation, or data filtering, but it is in the area of writing flexible tests that matchers are most commonly used. This tutorial shows you how to use PyHamcrest for unit testing.

When writing tests it is sometimes difficult to get the balance right between overspecifying the test (and making it brittle to changes), and not specifying enough (making the test less valuable since it continues to pass even when the thing being tested is broken). Having a tool that allows you to pick out precisely the aspect under test and describe the values it should have, to a controlled level of precision, helps greatly in writing tests that are "just right." Such tests fail when the behavior of the aspect under test deviates from the expected behavior, yet continue to pass when minor, unrelated changes to the behaviour are made.

1.2 My first PyHamcrest test

We'll start by writing a very simple PyUnit test, but instead of using PyUnit's assertEqual method, we'll use PyHamcrest's assert_that construct and the standard set of matchers:

```
from hamcrest import *
import unittest

class BiscuitTest (unittest.TestCase):
    def testEquals(self):
        theBiscuit = Biscuit('Ginger')
        myBiscuit = Biscuit('Ginger')
        assert_that(theBiscuit, equal_to(myBiscuit))

if __name__ == '__main__':
    unittest.main()
```

The assert_that function is a stylized sentence for making a test assertion. In this example, the subject of the assertion is the object theBiscuit, which is the first method parameter. The second method parameter is a matcher for Biscuit objects, here a matcher that checks one object is equal to another using the Python == operator. The test passes since the Biscuit class defines an __eq_ method.

If you have more than one assertion in your test you can include an identifier for the tested value in the assertion:

```
assert_that(theBiscuit.getChocolateChipCount(), equal_to(10), 'chocolate chips')
assert_that(theBiscuit.getHazelnutCount(), equal_to(3), 'hazelnuts')
```

As a convenience, assert_that can also be used to verify a boolean condition:

```
assert_that(theBiscuit.isCooked(), 'cooked')
```

This is equivalent to the assert_ method of unittest.TestCase, but because it's a standalone function, it offers greater flexibility in test writing.

1.3 Asserting Exceptions

There's a utility function and matcher available to help you test that your code has the expected behavior in situations where it should raise an exception. The <code>calling</code> function wraps a callable, and then allows you to set arguments to be used in a call to the wrapped callable. This, together with the <code>raises</code> matcher lets you assert that calling a method with certain arguments causes an exception to be thrown. It is also possible to provide a regular expression pattern to the <code>raises</code> matcher allowing you assure that the right issue was found:

1.4 Predefined matchers

PyHamcrest comes with a library of useful matchers:

- Object
 - equal_to match equal object
 - has_length match len (item)
 - has_property match value of property with given name
 - has_properties match an object that has all of the given properties.
 - has_string match str(item)
 - instance_of match object type
 - none, not none match None, or not None
 - same_instance match same object

- calling, raises - wrap a method call and assert that it raises an exception

• Number

- close_to match number close to a given value
- greater_than, greater_than_or_equal_to, less_than, less_than_or_equal_to match numeric ordering

· Text

- contains_string match part of a string
- ends_with match the end of a string
- equal_to_ignoring_case match the complete string but ignore case
- equal_to_ignoring_whitespace match the complete string but ignore extra whitespace
- starts_with match the beginning of a string
- string_contains_in_order match parts of a string, in relative order

• Logical

- all of and together all matchers
- any_of or together all matchers
- anything match anything, useful in composite matchers when you don't care about a particular value
- is_not negate the matcher
- not alias of is not for better readability of negations.

• Sequence

- contains exactly match the entire sequence
- contains_inanyorder match the entire sequence, but in any order
- has_item match if given item appears in the sequence
- has_items match if all given items appear in the list, in any order
- is_in match if item appears in the given sequence
- only_contains match if sequence's items appear in given list
- empty match if the sequence is empty

Dictionary

- has entries match dictionary with list of key-value pairs
- has_entry match dictionary containing a key-value pair
- has_key match dictionary with a key
- has_value match dictionary with a value

Decorator

- described_as give the matcher a custom failure description
- is_ decorator to improve readability see Syntactic sugar, below

The arguments for many of these matchers accept not just a matching value, but another matcher, so matchers can be composed for greater flexibility. For example, only_contains(less_than(5)) will match any sequence where every item is less than 5.

1.5 Syntactic sugar

PyHamcrest strives to make your tests as readable as possible. For example, the *is_* matcher is a wrapper that doesn't add any extra behavior to the underlying matcher. The following assertions are all equivalent:

```
assert_that(theBiscuit, equal_to(myBiscuit))
assert_that(theBiscuit, is_(equal_to(myBiscuit)))
assert_that(theBiscuit, is_(myBiscuit))
```

The last form is allowed since is_(value) wraps most non-matcher arguments with equal_to. But if the argument is a type, it is wrapped with instance_of, so the following are also equivalent:

```
assert_that(theBiscuit, instance_of(Biscuit))
assert_that(theBiscuit, is_(instance_of(Biscuit)))
assert_that(theBiscuit, is_(Biscuit))
```

(Note that PyHamcrest's is_ matcher is unrelated to Python's is operator. The matcher for object identity is same_instance.)

CHAPTER 2

Writing Custom Matchers

PyHamcrest comes bundled with lots of useful matchers, but you'll probably find that you need to create your own from time to time to fit your testing needs. This commonly occurs when you find a fragment of code that tests the same set of properties over and over again (and in different tests), and you want to bundle the fragment into a single assertion. By writing your own matcher you'll eliminate code duplication and make your tests more readable!

Let's write our own matcher for testing if a calendar date falls on a Saturday. This is the test we want to write:

```
def testDateIsOnASaturday(self):
    d = datetime.date(2008, 04, 26)
    assert_that(d, is_(on_a_saturday()))
```

And here's the implementation:

```
from hamcrest.core.base_matcher import BaseMatcher
from hamcrest.core.helpers.hasmethod import hasmethod
class IsGivenDayOfWeek (BaseMatcher):
    def __init__(self, day):
       self.day = day # Monday is 0, Sunday is 6
    def _matches(self, item):
        if not hasmethod(item, 'weekday'):
            return False
        return item.weekday() == self.day
   def describe_to(self, description):
        day_as_string = ['Monday', 'Tuesday', 'Wednesday', 'Thursday',
                         'Friday', 'Saturday', 'Sunday']
        description.append_text('calendar date falling on ')
                   .append_text(day_as_string[self.day])
def on_a_saturday():
   return IsGivenDayOfWeek (5)
```

For our Matcher implementation we implement the _matches method - which calls the weekday method after confirming that the argument (which may not be a date) has such a method - and the <code>describe_to</code> method - which is used to produce a failure message when a test fails. Here's an example of how the failure message looks:

```
assert_that(datetime.date(2008, 04, 06), is_(on_a_saturday()))
```

fails with the message:

```
AssertionError:
Expected: is calendar date falling on Saturday
got: <2008-04-06>
```

Let's say this matcher is saved in a module named isgivendayofweek. We could use it in our test by importing the factory function on_a_saturday:

```
from hamcrest import *
import unittest
from isgivendayofweek import on_a_saturday

class DateTest(unittest.TestCase):
    def testDateIsOnASaturday(self):
        d = datetime.date(2008, 04, 26)
        assert_that(d, is_(on_a_saturday()))

if __name__ == '__main__':
    unittest.main()
```

Even though the on_a_saturday function creates a new matcher each time it is called, you should not assume this is the only usage pattern for your matcher. Therefore you should make sure your matcher is stateless, so a single instance can be reused between matches.

If you need your matcher to provide more details in case of a mismatch, you can override the <code>describe_mismatch</code> method. For example, if we added this <code>describe_mismatch</code> implementation to our <code>IsGivenDayOfWeek</code> matcher:

Our matcher would now give the message:

```
AssertionError:
Expected: is calendar date falling on Saturday
got: <2008-04-06> which is a Sunday
```

Occasionally, you might also need your matcher to explain why it matched successfully. For example, if your matcher is wrapped by a <code>is_not</code> matcher, the <code>is_not</code> matcher can only explain its mismatches by understanding why your matcher succeeded. In this case, your matcher can implement <code>describe_match</code>.

CHAPTER 3

Matcher Library

Library of Matcher implementations.

3.1 Object Matchers

Matchers that inspect objects.

3.1.1 equal_to

```
class hamcrest.core.core.isequal.IsEqual(equals: Any)
    Bases: hamcrest.core.base_matcher.BaseMatcher
```

 $\mbox{\tt describe_to} \ (\textit{description: hamcrest.core.description.Description}) \ \rightarrow \mbox{\tt None} \\ \mbox{\tt Generates a description of the object.}$

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

Matches if object is equal to a given object.

Parameters obj – The object to compare against as the expected value.

This matcher compares the evaluated object to obj for equality.

3.1.2 has_length

```
{\it class hamcrest.library.object.haslength. HasLength ({\it len\_matcher: ham-crest.core.matcher.Matcher[int][int]})}\\ {\it Bases: hamcrest.core.base\_matcher.BaseMatcher}}
```

describe mismatch (item: collections.abc.Sized, mismatch description: ham $crest.core.description.Description) \rightarrow None$

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch_description The description to be built or appended to.

 $describe_to(description: hamcrest.core.description.Description) \rightarrow None$ Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.object.haslength.has_length (match:
                                                                             Union[int,
                                                                                             ham-
                                                           crest.core.matcher.Matcher[int][int]])
                                                           hamcrest.core.matcher.Matcher[collections.abc.Sized][collections.al
```

Matches if len (item) satisfies a given matcher.

Parameters match – The matcher to satisfy, or an expected value for equal_to matching.

This matcher invokes the len function on the evaluated object to get its length, passing the result to a given matcher for evaluation.

If the match argument is not a matcher, it is implicitly wrapped in an equal_to matcher to check for equality.

Examples:

```
has_length(greater_than(6))
has_length(5)
```

3.1.3 has string

```
class hamcrest.library.object.hasstring.HasString(str matcher:
                                                                                         ham-
                                                               crest.core.matcher.Matcher[str][str])
     Bases: hamcrest.core.base matcher.BaseMatcher
     describe\_to (description: hamcrest.core.description.Description) \rightarrow None
```

Generates a description of the object. The description may be part of a description of a larger object of which this is just a component, so it

Parameters description – The description to be built or appended to.

```
ham-
hamcrest.library.object.hasstring.has_string(match)
                                                         crest.core.matcher.Matcher[object][object]
     Matches if str (item) satisfies a given matcher.
```

should be worded appropriately.

Parameters match – The matcher to satisfy, or an expected value for equal_to matching.

This matcher invokes the str function on the evaluated object to get its length, passing the result to a given matcher for evaluation. If the match argument is not a matcher, it is implicitly wrapped in an equal_to matcher to check for equality.

Examples:

```
has_string(starts_with('foo'))
has_string('bar')
```

3.1.4 has_properties/has_property

Bases: hamcrest.core.base matcher.BaseMatcher

 $\textbf{describe_mismatch} (\textit{item: object, mismatch_description: hamcrest.core.description.} Description)$

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch_description The description to be built or appended to.

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

hamcrest.library.object.hasproperty.has_properties (*keys_valuematchers, **kv_args)

Matches if an object has properties satisfying all of a dictionary of string property names and corresponding value matchers.

Parameters matcher_dict – A dictionary mapping keys to associated value matchers, or to expected values for equal_to matching.

Note that the keys must be actual keys, not matchers. Any value argument that is not a matcher is implicitly wrapped in an equal_to matcher to check for equality.

Examples:

```
has_properties({'foo':equal_to(1), 'bar':equal_to(2)})
has_properties({'foo':1, 'bar':2})
```

has_properties also accepts a list of keyword arguments:

Parameters

- **keyword1** A keyword to look up.
- valueMatcher1 The matcher to satisfy for the value, or an expected value for equal_to matching.

Examples:

```
has_properties(foo=equal_to(1), bar=equal_to(2))
has_properties(foo=1, bar=2)
```

Finally, has_properties also accepts a list of alternating keys and their value matchers:

hamcrest.library.object.hasproperty.has_properties(key1, value_matcher1[, ...])

Parameters

- **key1** A key (not a matcher) to look up.
- **valueMatcher1** The matcher to satisfy for the value, or an expected value for equal_to matching.

Examples:

```
has_properties('foo', equal_to(1), 'bar', equal_to(2))
has_properties('foo', 1, 'bar', 2)
```

```
hamcrest.library.object.hasproperty.has_property (name: str, match: Union[None, hamcrest.core.matcher.Matcher[\sim V][V], V] = None) \rightarrow hamcrest.core.matcher.Matcher[object][object]
```

Matches if object has a property with a given name whose value satisfies a given matcher.

Parameters

- name The name of the property.
- match Optional matcher to satisfy.

This matcher determines if the evaluated object has a property with a given name. If no such property is found, has_property is not satisfied.

If the property is found, its value is passed to a given matcher for evaluation. If the match argument is not a matcher, it is implicitly wrapped in an equal_to matcher to check for equality.

If the match argument is not provided, the *anything* matcher is used so that has_property is satisfied if a matching property is found.

Examples:

```
has_property('name', starts_with('J'))
has_property('name', 'Jon')
has_property('name')
```

3.1.5 instance_of

 $\textbf{describe_to} \ (\textit{description: hamcrest.core.description.Description}) \ \to \ None$ Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

 $\label{local_core.core.core.isinstance} \textbf{hamcrest.core.core.isinstanceof.instance_of}(\textit{atype:} \quad \textit{Type[CT_co]}) \quad \rightarrow \quad \text{hamcrest.core.matcher.Matcher[object]}(\texttt{object})$

Matches if object is an instance of, or inherits from, a given type.

Parameters atype – The type to compare against as the expected type.

This matcher checks whether the evaluated object is an instance of atype or an instance of any class that inherits from atype.

Example:

instance_of(str)

3.1.6 none, not_none

```
class hamcrest.core.core.isnone.IsNone
```

Bases: hamcrest.core.base_matcher.BaseMatcher

 $\textbf{describe_to} (\textit{description: hamcrest.core.description.Description}) \rightarrow \textbf{None}$

Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

hamcrest.core.core.isnone.none() \rightarrow hamcrest.core.matcher.Matcher[typing.Union[typing.Any, NoneType]][Optional[Any]]

Matches if object is None.

 $\label{eq:hamcrest.core.matcher.Matcher} \begin{tabular}{ll} hamcrest.core.core.isnone.not_none() \rightarrow hamcrest.core.matcher.Matcher[typing.Union[typing.Any, NoneType]][Optional[Any]] \end{tabular}$

Matches if object is not None.

3.1.7 same_instance

```
class hamcrest.core.core.issame.IsSame(obj: T)
    Bases: hamcrest.core.base matcher.BaseMatcher
```

 $\textbf{describe_mismatch}(\textit{item:} \ T, \ \textit{mismatch_description:} \ \textit{hamcrest.core.description.Description}) \ \rightarrow \\ \text{None}$

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch_description The description to be built or appended to.

describe_to (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

hamcrest.core.core.issame.same_instance (obj: T) \rightarrow hamcrest.core.matcher.Matcher[~T][T] Matches if evaluated object is the same instance as a given object.

Parameters obj – The object to compare against as the expected value.

This matcher invokes the is identity operator to determine if the evaluated object is the the same object as obj.

3.1.8 calling, raises

```
class hamcrest.core.core.raises.Raises(expected: Type[Exception], pattern: Optional[str] = None, matching: Optional[hamcrest.core.matcher.Matcher] = None)

Bases: hamcrest.core.base_matcher.BaseMatcher
```

 $describe_match$ (item, match_description: hamcrest.core.description.Description) \rightarrow None Generates a description of why the matcher has accepted the item.

The description may be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is True, but will not check this.

Parameters

- item The item that the *Matcher* has accepted.
- match_description The description to be built or appended to.

describe_mismatch (*item*, *description*: *hamcrest.core.description*. *Description*) \rightarrow None Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the Matcher has rejected.
- mismatch_description The description to be built or appended to.

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.core.core.raises.calling (func: Callable[[...], Any]) \rightarrow hamcrest.core.core.raises.DeferredCallable Wrapper for function call that delays the actual execution so that raises matcher can catch any thrown exceptions.
```

Wrapper for function call that delays the actual execution so that *raises* matcher can catch any thrown exception.

Parameters func – The function or method to be called

The arguments can be provided with a call to the with args function on the returned object:

Parameters

- exception The class of the expected exception
- pattern Optional regular expression to match exception message.
- matching Optional Hamcrest matchers to apply to the exception.

Expects the actual to be wrapped by using <code>calling</code>, or a callable taking no arguments. Optional argument pattern should be a string containing a regular expression. If provided, the string representation of the actual exception - e.g. <code>str(actual)</code> - must match pattern.

Examples:

```
assert_that(calling(int).with_args('q'), raises(TypeError))
assert_that(calling(parse, broken_input), raises(ValueError))
assert_that(
    calling(valid_user, bad_json),
    raises(HTTPError, matching=has_properties(status_code=500)
)
```

3.2 Number Matchers

Matchers that perform numeric comparisons.

3.2.1 close to

Bases: hamcrest.core.base_matcher.BaseMatcher

 $\begin{tabular}{ll} \textbf{describe_mismatch} (item: Union[float, decimal.Decimal], mismatch_description: ham-crest.core.description.Description) \rightarrow None \\ Generates a description of why the matcher has not accepted the item. \\ \end{tabular}$

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch_description The description to be built or appended to.

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.number.iscloseto.close_to (value, delta)

Matches if object is a number close to a given value, within a given delta.
```

Parameters

• **value** – The value to compare against as the expected value.

3.2. Number Matchers 15

 delta – The maximum delta between the values for which the numbers are considered close.

This matcher compares the evaluated object against value to see if the difference is within a positive delta.

Example:

```
close_to(3.0, 0.25)
```

```
hamcrest.library.number.iscloseto.isnumeric(value: Any) \rightarrow bool Confirm that 'value' can be treated numerically; duck-test accordingly
```

3.2.2 greater_than, greater_than_or_equal_to, less_than, less_than_or_equal_to

```
 \begin{array}{c} \textbf{class} \text{ hamcrest.library.number.ordering\_comparison.} \textbf{OrderingComparison} (\textit{value:} \\ Any, \\ com-\\ pari-\\ son\_function: \\ Callable[[Any, \\ Any], \\ bool], \\ com-\\ pari-\\ son\_description: \\ str) \end{array}
```

Bases: hamcrest.core.base matcher.BaseMatcher

 $\mbox{\tt describe_to} \ (\textit{description: hamcrest.core.description.Description}) \ \rightarrow \mbox{\tt None} \\ \mbox{\tt Generates a description of the object.}$

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.number.ordering_comparison.greater_than (value: Any) \rightarrow hamcrest.core.matcher.Matcher[typing.Any][Any] Matches if object is greater than a given value.
```

Parameters value – The value to compare against.

```
\label{library.number.ordering_comparison.greater_than_or_equal_to} (\textit{value: } Any) \\ \rightarrow \\ \text{ham-} \\ \text{crest.core.matcher.Matcher[typi]}
```

Matches if object is greater than or equal to a given value.

```
Parameters value – The value to compare against.
```

```
hamcrest.library.number.ordering_comparison.less_than (value: Any) \rightarrow hamcrest.core.matcher.Matcher[typing.Any][Any] Matches if object is less than a given value.
```

Parameters value – The value to compare against.

```
hamcrest.library.number.ordering_comparison.less_than_or_equal_to(value:
Any)
\rightarrow \quad \text{ham-}
\text{crest.core.matcher.Matcher[typing.A]}
```

Matches if object is less than or equal to a given value.

Parameters value – The value to compare against.

3.3 Text Matchers

Matchers that perform text comparisons.

3.3.1 contains string

```
class hamcrest.library.text.stringcontains.StringContains (substring)

Bases: hamcrest.library.text.substringmatcher.SubstringMatcher

hamcrest.library.text.stringcontains.contains_string(substring: str) → hamcrest.core.matcher.Matcher[str][str]

Matches if object is a string containing a given string.
```

Parameters string – The string to search for.

This matcher first checks whether the evaluated object is a string. If so, it checks whether it contains string.

Example:

```
contains_string("def")
```

will match "abcdefg".

3.3.2 ends with

```
class hamcrest.library.text.stringendswith.StringEndsWith(substring)
    Bases: hamcrest.library.text.substringmatcher.SubstringMatcher
hamcrest.library.text.stringendswith.ends_with(string: str) → hamcrest.core.matcher.Matcher[str][str]
    Matches if object is a string ending with a given string.
```

Parameters string – The string to search for.

This matcher first checks whether the evaluated object is a string. If so, it checks if string matches the ending characters of the evaluated object.

Example:

```
ends_with("bar")
```

will match "foobar".

3.3.3 equal_to_ignoring_case

3.3. Text Matchers 17

 $describe_to(description: hamcrest.core.description.Description) \rightarrow None$ Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.text.isequal_ignoring_case.equal_to_ignoring_case (string:
                                                                                     \rightarrow
                                                                                         ham-
                                                                                    crest.core.matcher.Matcher[str][str
```

Matches if object is a string equal to a given string, ignoring case differences.

Parameters string – The string to compare against as the expected value.

This matcher first checks whether the evaluated object is a string. If so, it compares it with string, ignoring differences of case.

Example:

```
equal_to_ignoring_case("hello world")
```

will match "heLLo WorlD".

3.3.4 equal to ignoring whitespace

```
class hamcrest.library.text.isequal_ignoring_whitespace.IsEqualIgnoringWhiteSpace(string)
    Bases: hamcrest.core.base matcher.BaseMatcher
```

```
describe\_to (description: hamcrest.core.description.Description) \rightarrow None
     Generates a description of the object.
```

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.text.isequal_ignoring_whitespace.equal_to_ignoring_whitespace(string:
                                                                                    str)
```

 \rightarrow

ham-

crest.core.matche

Matches if object is a string equal to a given string, ignoring differences in whitespace.

Parameters string – The string to compare against as the expected value.

This matcher first checks whether the evaluated object is a string. If so, it compares it with string, ignoring differences in runs of whitespace.

Example:

```
equal_to_ignoring_whitespace("hello world")
```

will match "hello world".

3.3.5 matches regexp

```
class hamcrest.library.text.stringmatches.StringMatchesPattern(pattern)
    Bases: hamcrest.core.base_matcher.BaseMatcher
```

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
\label{eq:library.text.stringmatches.matches_regexp} \begin{array}{ccc} (pattern: & Union[str, & Pattern[str]]) & \rightarrow & \text{ham-crest.core.matcher.Matcher[str][str]} \end{array}
```

Matches if object is a string containing a match for a given regular expression.

Parameters pattern – The regular expression to search for.

This matcher first checks whether the evaluated object is a string. If so, it checks if the regular expression pattern matches anywhere within the evaluated object.

3.3.6 starts_with

```
class hamcrest.library.text.stringstartswith.StringStartsWith(substring)
    Bases: hamcrest.library.text.substringmatcher.SubstringMatcher
hamcrest.library.text.stringstartswith.starts_with(substring: str) → hamcrest.core.matcher.Matcher[str][str]
    Matches if object is a string starting with a given string.
```

Parameters string – The string to search for.

This matcher first checks whether the evaluated object is a string. If so, it checks if string matches the beginning characters of the evaluated object.

Example:

```
starts_with("foo")
```

will match "foobar".

3.3.7 string_contains_in_order

```
\textbf{describe\_to} \ (\textit{description: hamcrest.core.description.Description}) \ \to \ None Generates a description of the object.
```

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.text.stringcontainsinorder.string_contains_in_order(string1[, string2[, ...]])
```

Matches if object is a string containing a given list of substrings in relative order.

```
Parameters string1, ... – A comma-separated list of strings.
```

This matcher first checks whether the evaluated object is a string. If so, it checks whether it contains a given list of strings, in relative order to each other. The searches are performed starting from the beginning of the evaluated string.

3.3. Text Matchers 19

Example:

```
string_contains_in_order("bc", "fg", "jkl")
```

will match "abcdefghijklm".

3.4 Logical Matchers

Boolean logic using other matchers.

3.4.1 all of

```
class hamcrest.core.core.allof.Allof(*matchers, **kwargs)
    Bases: hamcrest.core.base matcher.BaseMatcher
```

 $\textbf{describe_mismatch}(\textit{item:} \ T, \ \textit{mismatch_description:} \ \textit{hamcrest.core.description.Description}) \ \rightarrow \\ \text{None}$

None Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch_description The description to be built or appended to.

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

 $\textbf{matches} \ (\textit{item: T, mismatch_description: Optional[hamcrest.core.description.Description] = None)} \ \rightarrow \\ \text{bool}$

Evaluates the matcher for argument item.

If a mismatch is detected and argument mismatch_description is provided, it will generate a description of why the matcher has not accepted the item.

Parameters

- item The object against which the matcher is evaluated.
- mismatch_description -

Returns True if item matches, otherwise False.

```
\verb|hamcrest.core.core.allof.all_of(matcher1[, matcher2[, ...]])|
```

Matches if all of the given matchers evaluate to True.

Parameters matcher1, ... – A comma-separated list of matchers.

The matchers are evaluated from left to right using short-circuit evaluation, so evaluation stops as soon as a matcher returns False.

Any argument that is not a matcher is implicitly wrapped in an equal_to matcher to check for equality.

3.4.2 any_of

```
class hamcrest.core.core.anyof.AnyOf(*matchers)
    Bases: hamcrest.core.base_matcher.BaseMatcher
```

 $\textbf{describe_to} (\textit{description: hamcest.core.description.Description}) \rightarrow \textbf{None}$

Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.core.core.anyof.any_of (matcher1[, matcher2[, ...]])

Matches if any of the given matchers evaluate to True.
```

Parameters matcher1, . . - A comma-separated list of matchers.

The matchers are evaluated from left to right using short-circuit evaluation, so evaluation stops as soon as a matcher returns True.

Any argument that is not a matcher is implicitly wrapped in an equal_to matcher to check for equality.

3.4.3 anything

```
class hamcrest.core.isanything.IsAnything(description: Optional[str])
    Bases: hamcrest.core.base_matcher.BaseMatcher
```

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.core.core.isanything.anything([description]) Matches anything.
```

Parameters description – Optional string used to describe this matcher.

This matcher always evaluates to True. Specify this in composite matchers when the value of a particular element is unimportant.

3.4.4 is not

 $\textbf{describe_mismatch} (\textit{item: } T, \textit{mismatch_description: } \textit{hamcrest.core.description.Description}) \rightarrow \\ \textit{None}$

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- **mismatch_description** The description to be built or appended to.

 $\textbf{describe_to} \ (\textit{description: hamcrest.core.description.Description}) \ \rightarrow \text{None} \\ \text{Generates a description of the object.}$

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.core.core.isnot.is_not (match)
```

Inverts the given matcher to its logical negation.

Parameters match - The matcher to negate.

This matcher compares the evaluated object to the negation of the given matcher. If the match argument is not a matcher, it is implicitly wrapped in an equal_to matcher to check for equality, and thus matches for inequality.

Examples:

```
assert_that(cheese, is_not(equal_to(smelly)))
assert_that(cheese, is_not(smelly))
```

hamcrest.core.core.isnot.not_(match: Union[hamcrest.core.matcher.Matcher[$\sim T$][T], T]) \rightarrow hamcrest.core.matcher.Matcher[$\sim T$][T]

Alias of *is_not* for better readability of negations.

Examples:

```
assert_that(alist, not_(has_item(item)))
```

3.5 Sequence Matchers

Matchers of sequences.

3.5.1 contains exactly

 $\textbf{class} \ \texttt{hamcrest.library.collection.issequence_containinginorder.IsSequenceContainingInOrder.issequenceCont$

Bases: hamcrest.core.base matcher.BaseMatcher

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the Matcher has rejected.
- mismatch_description The description to be built or appended to.

 $\textbf{describe_to} \ (\textit{description: hamcrest.core.description.Description}) \ \rightarrow \ None$

Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

matches (item: Sequence[T], mismatch_description: Optional[hamcrest.core.description.Description] = None) \rightarrow bool

Evaluates the matcher for argument item.

If a mismatch is detected and argument mismatch_description is provided, it will generate a description of why the matcher has not accepted the item.

Parameters

- item The object against which the matcher is evaluated.
- mismatch description -

Returns True if item matches, otherwise False.

hamcrest.library.collection.issequence_containinginorder.contains_exactly(match1[, match2[,

Matches if sequence's elements satisfy a given list of matchers, in order.

Parameters match1, ... – A comma-separated list of matchers.

This matcher iterates the evaluated sequence and a given list of matchers, seeing if each element satisfies its corresponding matcher.

Any argument that is not a matcher is implicitly wrapped in an equal_to matcher to check for equality.

3.5.2 contains inanyorder

class hamcrest.library.collection.issequence_containinginanyorder.IsSequenceContainingInAn

Bases: hamcrest.core.base_matcher.BaseMatcher

 $\begin{tabular}{ll} \textbf{describe_mismatch} (item: & Sequence[T], & mismatch_description: & ham-crest.core.description.Description) \rightarrow None \\ \end{tabular}$

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch_description The description to be built or appended to.

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

matches (item: Sequence[T], mismatch_description: Optional[hamcrest.core.description.Description] = None) \rightarrow bool Evaluates the matcher for argument item.

If a mismatch is detected and argument mismatch_description is provided, it will generate a description of why the matcher has not accepted the item.

Parameters

- item The object against which the matcher is evaluated.
- mismatch_description -

Returns True if item matches, otherwise False.

hamcrest.library.collection.issequence_containinginanyorder.contains_inanyorder(match1 | match2 |,

Matches if sequences's elements, in any order, satisfy a given list of matchers.

Parameters match1, ... – A comma-separated list of matchers.

This matcher iterates the evaluated sequence, seeing if each element satisfies any of the given matchers. The matchers are tried from left to right, and when a satisfied matcher is found, it is no longer a candidate for the remaining elements. If a one-to-one correspondence is established between elements and matchers, contains_inanyorder is satisfied.

Any argument that is not a matcher is implicitly wrapped in an equal_to matcher to check for equality.

3.5.3 has item, has items

class hamcrest.library.collection.issequence_containing.IsSequenceContaining(element_matcher:

crest.core.matcher.M

Bases: hamcrest.core.base matcher.BaseMatcher

describe_to (*description: hamcrest.core.description.Description*) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

 $\begin{tabular}{ll} \textbf{describe_mismatch} (item: & Sequence[T], & mismatch_description: & ham-\\ & crest.core.description.Description) \rightarrow \textbf{None} \\ \end{tabular}$

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch_description The description to be built or appended to.

describe_to (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

hamcrest.library.collection.issequence_containing.has_item(match:

 $Union[hamcrest.core.matcher.Matcher[\sim T][T]$

crest.core.matcher.Matcher[typing.Sequence[~

TJ) \rightarrow ham-

Matches if any element of sequence satisfies a given matcher.

Parameters match – The matcher to satisfy, or an expected value for equal_to matching.

This matcher iterates the evaluated sequence, searching for any element that satisfies a given matcher. If a matching element is found, has_item is satisfied.

If the match argument is not a matcher, it is implicitly wrapped in an equal_to matcher to check for equality.

```
hamcrest.library.collection.issequence_containing.has_items(match1[, match2[,...
```

Matches if all of the given matchers are satisfied by any elements of the sequence.

Parameters match1, . . - A comma-separated list of matchers.

This matcher iterates the given matchers, searching for any elements in the evaluated sequence that satisfy them. If each matcher is satisfied, then has_items is satisfied.

Any argument that is not a matcher is implicitly wrapped in an equal_to matcher to check for equality.

3.5.4 is in

```
class hamcrest.library.collection.isin.IsIn(sequence: Sequence[T])
    Bases: hamcrest.core.base_matcher.BaseMatcher
```

describe_to (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.collection.isin.is_in (sequence: Sequence[T]) \rightarrow hamcrest.core.matcher.Matcher[\simT][T]
```

Matches if evaluated object is present in a given sequence.

Parameters sequence – The sequence to search.

This matcher invokes the in membership operator to determine if the evaluated object is a member of the sequence.

3.5.5 only_contains

```
class hamcrest.library.collection.issequence_onlycontaining.IsSequenceOnlyContaining(matcher
```

hamcrest.co

Bases: hamcrest.core.base_matcher.BaseMatcher

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.collection.issequence_onlycontaining.only_contains(match1[, match2[, ...]])
```

Matches if each element of sequence satisfies any of the given matchers.

Parameters match1, . . - A comma-separated list of matchers.

This matcher iterates the evaluated sequence, confirming whether each element satisfies any of the given matchers

Example:

```
only_contains(less_than(4))
```

will match [3, 1, 2].

Any argument that is not a matcher is implicitly wrapped in an equal_to matcher to check for equality.

3.5.6 empty

```
class hamcrest.library.collection.is_empty.IsEmpty
    Bases: hamcrest.core.base_matcher.BaseMatcher
```

describe_to (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
matches (item: Sized, mismatch_description: Optional[hamcrest.core.description.Description] = None) \rightarrow bool Evaluates the matcher for argument item.
```

If a mismatch is detected and argument mismatch_description is provided, it will generate a description of why the matcher has not accepted the item.

Parameters

- item The object against which the matcher is evaluated.
- mismatch description -

Returns True if item matches, otherwise False.

```
hamcrest.library.collection.is_empty.empty()
```

This matcher matches any collection-like object that responds to the <u>len</u> method, and has a length of 0.

3.6 Dictionary Matchers

Matchers of dictionaries.

3.6.1 has entries

class hamcrest.library.collection.isdict_containingentries.IsDictContainingEntries(value_mate
Bases: hamcrest.core.base matcher.BaseMatcher

 $\textbf{describe_keyvalue} (\textit{index: int, value: V, description: hamcrest.core.description.Description}) \rightarrow \\ \textbf{None}$

Describes key-value pair at given index.

 $\begin{tabular}{lll} \textbf{describe_mismatch} (item: & Mapping[K, & V], & mismatch_description: & ham-\\ & crest.core.description.Description) & \to None \\ \end{tabular}$

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch description The description to be built or appended to.

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

matches (item: Mapping[K, V], mismatch_description: Optional[hamcrest.core.description.Description] = None) \rightarrow bool Evaluates the matcher for argument item.

If a mismatch is detected and argument mismatch_description is provided, it will generate a description of why the matcher has not accepted the item.

Parameters

- item The object against which the matcher is evaluated.
- mismatch_description -

Returns True if item matches, otherwise False.

hamcrest.library.collection.isdict_containingentries.has_entries(matcher_dict)

Matches if dictionary contains entries satisfying a dictionary of keys and corresponding value matchers.

Parameters matcher_dict – A dictionary mapping keys to associated value matchers, or to expected values for equal_to matching.

Note that the keys must be actual keys, not matchers. Any value argument that is not a matcher is implicitly wrapped in an equal to matcher to check for equality.

Examples:

```
has_entries({'foo':equal_to(1), 'bar':equal_to(2)})
has_entries({'foo':1, 'bar':2})
```

has_entries also accepts a list of keyword arguments:

```
hamcrest.library.collection.isdict_containingentries.has_entries(keyword1=value_matcher1[, key-word2=value_matcher2[, ...])
```

Parameters

• **keyword1** – A keyword to look up.

• valueMatcher1 - The matcher to satisfy for the value, or an expected value for equal_to matching.

Examples:

```
has_entries(foo=equal_to(1), bar=equal_to(2))
has_entries(foo=1, bar=2)
```

Finally, has_entries also accepts a list of alternating keys and their value matchers:

```
hamcrest.library.collection.isdict_containingentries.has_entries(key1, value_matcher1[, ...])
```

Parameters

- **key1** A key (not a matcher) to look up.
- valueMatcher1 The matcher to satisfy for the value, or an expected value for equal_to matching.

Examples:

```
has_entries('foo', equal_to(1), 'bar', equal_to(2))
has_entries('foo', 1, 'bar', 2)
```

3.6.2 has entry

crest.core.matcher.Matcher[~K]
value matcher:

ham-

crest.core.matcher.Matcher[~V]

Bases: hamcrest.core.base_matcher.BaseMatcher

 $\mbox{\bf describe_to} \ (\mbox{\it description: hamcrest.core.description.Description}) \ \rightarrow \mbox{None} \\ \mbox{Generates a description of the object.}$

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.collection.isdict_containing.has_entry(key_match:
```

Union[K, ham-

crest.core.matcher.Matcher[~K][K]],

value_match:

Union[V, ham-

crest.core.matcher.Matcher[~V][V]])

 \rightarrow ham

 $crest.core.matcher.Matcher[typing.Mapping[{\sim}K,$

~V]][Mapping[K, V]]

Matches if dictionary contains key-value entry satisfying a given pair of matchers.

Parameters

- **key_match** The matcher to satisfy for the key, or an expected value for equal_to matching.
- **value_match** The matcher to satisfy for the value, or an expected value for equal_to matching.

This matcher iterates the evaluated dictionary, searching for any key-value entry that satisfies key_match and value_match. If a matching entry is found, has_entry is satisfied.

Any argument that is not a matcher is implicitly wrapped in an equal to matcher to check for equality.

Examples:

```
has_entry(equal_to('foo'), equal_to(1))
has_entry('foo', 1)
```

3.6.3 has key

crest.core.matcher.Mat

Bases: hamcrest.core.base_matcher.BaseMatcher

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.collection.isdict_containingkey.has_key(key_match:
```

Union[K, hamcrest.core.matcher.Matcher[~K][K]])

→ hamcrest.core.matcher.Matcher[typing.Mapping[~K,
typ-

ing.Any]][Mapping[K,
Any]]

Matches if dictionary contains an entry whose key satisfies a given matcher.

Parameters key_match – The matcher to satisfy for the key, or an expected value for equal_to matching.

This matcher iterates the evaluated dictionary, searching for any key-value entry whose key satisfies the given matcher. If a matching entry is found, has_key is satisfied.

Any argument that is not a matcher is implicitly wrapped in an equal_to matcher to check for equality.

Examples:

```
has_key(equal_to('foo'))
has_key('foo')
```

3.6.4 has value

crest.core.matche

Bases: hamcrest.core.base_matcher.BaseMatcher

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

```
hamcrest.library.collection.isdict_containingvalue.has_value(value:
```

Union[V, hamcrest.core.matcher.Matcher[~V][V]])

→ hamcrest.core.matcher.Matcher[typing.Mapping
~V]][Mapping[Any,
V]]

Matches if dictionary contains an entry whose value satisfies a given matcher.

Parameters value_match – The matcher to satisfy for the value, or an expected value for equal_to matching.

This matcher iterates the evaluated dictionary, searching for any key-value entry whose value satisfies the given matcher. If a matching entry is found, has_value is satisfied.

Any argument that is not a matcher is implicitly wrapped in an equal_to matcher to check for equality.

Examples:

```
has_value(equal_to('bar'))
has_value('bar')
```

3.7 Decorator Matchers

Matchers that decorate other matchers for better expression.

3.7.1 described as

str, matcher: hamcrest.core.matcher.Matcher[typing.Any][Any], *values)

Bases: hamcrest.core.base_matcher.BaseMatcher

 $\textbf{describe_mismatch} (\textit{item: Any, mismatch_description: hamcrest.core.description.Description}) \rightarrow \\ \textbf{None}$

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch_description The description to be built or appended to.

 $\textbf{describe_to} \ (\textit{description: hamcrest.core.description.Description}) \ \rightarrow \ None$

Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

 $\begin{tabular}{ll} \textbf{matches} (item: Any, mismatch_description: Optional[hamcrest.core.description.Description] = None) \\ \rightarrow bool \\ \end{tabular}$

Evaluates the matcher for argument item.

If a mismatch is detected and argument mismatch_description is provided, it will generate a description of why the matcher has not accepted the item.

Parameters

- item The object against which the matcher is evaluated.
- mismatch_description -

Returns True if item matches, otherwise False.

hamcrest.core.core.described_as.described_as (description, matcher[, value1[, ...]])
Adds custom failure description to a given matcher.

Parameters

- **description** Overrides the matcher's description.
- **matcher** The matcher to satisfy.
- value1, . . Optional comma-separated list of substitution values.

The description may contain substitution placeholders %0, %1, etc. These will be replaced by any values that follow the matcher.

3.7.2 is

 $\textbf{describe_mismatch} \ (\textit{item:} \ T, \ \textit{mismatch_description:} \ \ \textit{hamcrest.core.description.Description}) \ \rightarrow \\ \text{None}$

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch_description The description to be built or appended to.

describe_to (description: hamcrest.core.description.Description)

Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

3.7. Decorator Matchers 31

Parameters description – The description to be built or appended to.

 $\textbf{matches} \ (\textit{item: T, mismatch_description: Optional[hamcrest.core.description.Description] = None)} \ \rightarrow \\ \text{bool}$

Evaluates the matcher for argument item.

If a mismatch is detected and argument mismatch_description is provided, it will generate a description of why the matcher has not accepted the item.

Parameters

- item The object against which the matcher is evaluated.
- mismatch description -

Returns True if item matches, otherwise False.

```
hamcrest.core.core.is_.is_(x)
```

Decorates another matcher, or provides shortcuts to the frequently used $is(equal_to(x))$ and is(instance of(x)).

Parameters \mathbf{x} – The matcher to satisfy, or a type for <code>instance_of</code> matching, or an expected value for <code>equal_to</code> matching.

This matcher compares the evaluated object to the given matcher.

Note: PyHamcrest's is_ matcher is unrelated to Python's is operator. The matcher for object identity is same_instance.

If the x argument is a matcher, its behavior is retained, but the test may be more expressive. For example:

```
assert_that(value, less_than(5))
assert_that(value, is_(less_than(5)))
```

If the x argument is a type, it is wrapped in an *instance_of* matcher. This makes the following statements equivalent:

```
assert_that(cheese, instance_of(Cheddar))
assert_that(cheese, is_(instance_of(Cheddar)))
assert_that(cheese, is_(Cheddar))
```

Otherwise, if the x argument is not a matcher, it is wrapped in an equal_to matcher. This makes the following statements equivalent:

```
assert_that(cheese, equal_to(smelly))
assert_that(cheese, is_(equal_to(smelly)))
assert_that(cheese, is_(smelly))
```

Choose the style that makes your expression most readable. This will vary depending on context.

Integration with PyUnit and Other Libraries

4.1 assert_that

hamcrest.core.assert_that.assert_that(actual, matcher[, reason])
Asserts that actual value satisfies matcher. (Can also assert plain boolean condition.)

Parameters

- actual The object to evaluate as the actual value.
- matcher The matcher to satisfy as the expected condition.
- reason Optional explanation to include in failure description.

assert_that passes the actual value to the matcher for evaluation. If the matcher is not satisfied, an exception is thrown describing the mismatch.

assert_that is designed to integrate well with PyUnit and other unit testing frameworks. The exception raised for an unmet assertion is an AssertionError, which PyUnit reports as a test failure.

With a different set of parameters, assert_that can also verify a boolean condition:

```
hamcrest.core.assert_that.assert_that(assertion[, reason])
```

Parameters

- assertion Boolean condition to verify.
- reason Optional explanation to include in failure description.

This is equivalent to the assertTrue method of unittest. TestCase, but offers greater flexibility in test writing by being a standalone function.

4.2 match_equality

 $\begin{tabular}{ll} hamcrest.library.integration.match_equality.match_equality (matcher: hamcrest.core.matcher) & crest.core.matcher.Matcher) & & hamcrest.library.integration.match_equality.match_equality (matcher: hamcrest.core.matcher) & & hamcrest.library.integration.match_equality.match_equality (matcher: hamcrest.core.matcher) & & crest.core.matcher) & & hamcrest.library.integration.match_equality.match_equality (matcher: hamcrest.core.matcher) & & crest.core.matcher) & & cr$

crest.library.integration.match_equality.Equalit

Wraps a matcher to define equality in terms of satisfying the matcher.

match_equality allows Hamcrest matchers to be used in libraries that are not Hamcrest-aware. They might use the equality operator:

```
assert match_equality(matcher) == object
```

Or they might provide a method that uses equality for its test:

```
library.method_that_tests_eq(match_equality(matcher))
```

One concrete example is integrating with the assert_called_with methods in Michael Foord's mock library.

CHAPTER 5

Core API

5.1 Helpers

Utilities for writing Matchers

5.1.1 hasmethod

hamcrest.core.helpers.hasmethod.hasmethod(obj: object, methodname: str) \rightarrow bool Does obj have a method named methodname?

5.1.2 wrap_matcher

```
hamcrest.core.helpers.wrap_matcher.wrap_matcher (x: Union[hamcrest.core.matcher.Matcher[\sim T][T], T]) \rightarrow hamcrest.core.matcher.Matcher[\sim T][T]
```

Wraps argument in a matcher, if necessary.

Returns the argument as-is if it is already a matcher, otherwise wrapped in an equal_to matcher.

5.2 BaseDescription

```
class hamcrest.core.base_description.BaseDescription
    Bases: hamcrest.core.description.Description
    Base class for all Description implementations.
    append(string: str) → None
        Append the string to the description.
```

append_description_of (value: Any) \rightarrow hamcrest.core.description.Description Appends description of given value to this description.

If the value implements describe_to, then it will be used.

Returns self, for chaining

append_list (*start*: *str*; *separator*: *str*; *end*: *str*, *list*: *Iterable*[*Any*]) → hamcrest.core.description.Description
Appends a list of objects to the description.

Parameters

- **start** String that will begin the list description.
- **separator** String that will separate each object in the description.
- end String that will end the list description.
- list List of objects to be described.

Returns self, for chaining

 ${\tt append_text}~(\textit{text: str})~\rightarrow {\tt hamcrest.core.description}. Description$

Appends some plain text to the description.

Returns self, for chaining

5.3 BaseMatcher

```
class hamcrest.core.base_matcher.BaseMatcher
    Bases: hamcrest.core.matcher.Matcher
```

Base class for all *Matcher* implementations.

Most implementations can just implement _matches, leaving the handling of any mismatch description to the matches method. But if it makes more sense to generate the mismatch description during the matching, override matches instead.

```
\mathtt{matches}\,(item\colon T)\to \mathsf{bool}
```

 $describe_match$ (item: T, match_description: hamcrest.core.description.Description) \rightarrow None Generates a description of why the matcher has accepted the item.

The description may be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is True, but will not check this.

Parameters

- item The item that the *Matcher* has accepted.
- match_description The description to be built or appended to.

 $\textbf{describe_mismatch}(\textit{item:} \ T, \textit{mismatch_description:} \ \textit{hamcrest.core.description.Description}) \ \rightarrow \\ \text{None}$

Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

• item – The item that the *Matcher* has rejected.

• mismatch_description - The description to be built or appended to.

matches (item: T, mismatch_description: Optional[hamcrest.core.description.Description] = None) \rightarrow bool

Evaluates the matcher for argument item.

If a mismatch is detected and argument mismatch_description is provided, it will generate a description of why the matcher has not accepted the item.

Parameters

- item The object against which the matcher is evaluated.
- mismatch_description -

Returns True if item matches, otherwise False.

5.4 Description

```
\begin{tabular}{ll} \textbf{class} & \texttt{hamcrest.core.description.Description} \\ & \textbf{Bases:} & \texttt{object} \end{tabular}
```

A description of a Matcher.

A Matcher will describe itself to a description which can later be used for reporting.

append_description_of (*value: Any*) \rightarrow hamcrest.core.description.Description Appends description of given value to this description.

If the value implements describe_to, then it will be used.

```
Returns self, for chaining
```

```
append_list (start: str; separator: str; end: str; list: Iterable[Any]) → hamcrest.core.description.Description
Appends a list of objects to the description.
```

Parameters

- **start** String that will begin the list description.
- **separator** String that will separate each object in the description.
- end String that will end the list description.
- **list** List of objects to be described.

Returns self, for chaining

append_text (*text: str*) \rightarrow hamcrest.core.description.Description Appends some plain text to the description.

Returns self, for chaining

5.5 Matcher

```
class hamcrest.core.matcher.Matcher
    Bases: typing.Generic, hamcrest.core.selfdescribing.SelfDescribing
    A matcher over acceptable values.
```

A matcher is able to describe itself to give feedback when it fails.

5.4. Description 37

Matcher implementations should not directly implement this protocol. Instead, extend the BaseMatcher class, which will ensure that the Matcher API can grow to support new features and remain compatible with all Matcher implementations.

 $describe_match$ (item: T, match_description: hamcrest.core.description.Description) \rightarrow None Generates a description of why the matcher has accepted the item.

The description may be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is True, but will not check this.

Parameters

- item The item that the *Matcher* has accepted.
- match_description The description to be built or appended to.

 $describe_mismatch$ (item: T, mismatch_description: hamcrest.core.description.Description) \rightarrow None Generates a description of why the matcher has not accepted the item.

The description will be part of a larger description of why a matching failed, so it should be concise.

This method assumes that matches (item) is False, but will not check this.

Parameters

- item The item that the *Matcher* has rejected.
- mismatch_description The description to be built or appended to.

 $matches(item: T, mismatch_description: Optional[hamcrest.core.description.Description] = None) \rightarrow$

Evaluates the matcher for argument item.

If a mismatch is detected and argument mismatch_description is provided, it will generate a description of why the matcher has not accepted the item.

Parameters

- item The object against which the matcher is evaluated.
- mismatch_description -

Returns True if item matches, otherwise False.

5.6 SelfDescribing

class hamcrest.core.selfdescribing.SelfDescribing Bases: object

The ability of an object to describe itself.

 $describe_to$ (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the object.

The description may be part of a description of a larger object of which this is just a component, so it should be worded appropriately.

Parameters description – The description to be built or appended to.

5.7 SelfDescribingValue

```
class hamcrest.core.selfdescribingvalue.SelfDescribingValue(value: Any)
Bases: hamcrest.core.selfdescribing.SelfDescribing
```

Wrap any value in a SelfDescribingValue to satisfy the SelfDescribing interface.

Deprecated: No need for this class now that append_description_of handles any type of value.

describe_to (description: hamcrest.core.description.Description) \rightarrow None Generates a description of the value.

5.8 StringDescription

```
class hamcrest.core.string_description.StringDescription
    Bases: hamcrest.core.base_description.BaseDescription
```

A Description that is stored as a string.

append (*string*: str) \rightarrow None

Append the string to the description.

hamcrest.core.string_description.tostring(selfdescribing:

ham-

crest.core.selfdescribing.SelfDescribing)

 \rightarrow str .

Returns the description of a SelfDescribing object as a string.

Parameters selfdescribing – The object to be described.

Returns The description of the object.
